

ABSTRACT

Disclosed herein is a resin composition to be used for improving adhesion to the surface of synthetic resins, especially polyolefin-based resins. The resin composition comprises 100 parts by weight of chlorinated polyolefin with a chlorine content of 10 to 50 % by weight, 0.01 to 10 parts by weight of tris(isocyanatephenyl)thiophosphate, and 2 to 40 parts by weight of an organic diisocyanate compound. By adding the resin composition to general-purpose paints, it is possible to obtain paints capable of forming resin coated films excellent in adhesion to the surface of synthetic resins, especially polyolefin-based resins.
